

Spring 2017 Math 211 Exam 2 Review Sheet

The exam will be in class on Monday, March 27, and will cover Sections 14.1-14.8. You will not be allowed use of a calculator or any other device other than your pencil or pen and some scratch paper. Notes are also not allowed. In kindness to your fellow test-takers, please turn off all cell phones and anything that might beep or be a distraction.

Important topics:

- Level curves of $z=f(x,y)$
- Limits and continuity for functions of 2 variables (no ϵ - δ proofs on this exam)
- Computing partial derivatives from the definition (limit as h goes to 0 of the appropriate difference quotient)
- Partial derivatives
- Tangent plane to a surface
- Linear approximations to functions of 2 variables
- Chain rule
- Implicit differentiation of $F(x,y,z)=0$
- Computing directional derivatives and interpretation as steepness of surface
- Gradient and its importance (points in direction of greatest increase), and its relation to level sets (gradient perpendicular to level curve or level surface)
- Second Partials Test to find and classify critical points of a function (local max/min and saddle points)
- Optimization of multivariable functions, including Lagrange multipliers

Chapter 14 Review Exercises: 5, 13, 15, 19, 25, 27, 29, 31, 33, 37, 44, 45, 51, 53, 55

Answer to 44(d): $D_{\mathbf{u}}f = \nabla f \cdot \mathbf{u} = \|\nabla f\| \|\mathbf{u}\| \cos \theta = \frac{1}{2} \|\nabla f\|$ and \mathbf{u} is a unit vector, so the directional derivative is half of its maximum value (length of the gradient) when the angle between \mathbf{u} and $\|\nabla f\|$ is $\theta = \cos^{-1}(1/2) = 60$ degrees or $\pi/3$ radians.

Additional problems (answers on next page):

1. $\lim_{(x,y) \rightarrow (0,0)} \frac{2x^2 - y^2}{x^2 + 2y^2} = ?$

2. $\lim_{(x,y) \rightarrow (0,0)} \frac{\sin(3x^2 + y^2)}{x^2 + 2y^2} = ?$

3. $\lim_{(x,y) \rightarrow (0,0)} \frac{3x^3 - y^3}{x^2 + y^2} = ?$

4. You are given only the following information about a differentiable function f :

$$f(3, 2) = 8, \quad f(3.01, 2) = 7.9, \quad f(3, 1.98) = 7.6.$$

- Approximate the equation of the tangent plane to the surface $z=f(x,y)$ at $(3, 2, 8)$.
- Use part (a) to estimate the value of $f(3.02, 1.96)$.

5. Let $f(x,y) = \begin{cases} \frac{5x^3 + xy^2}{x^2 + y^2} & \text{if } (x,y) \neq (0,0) \\ 0 & \text{if } (x,y) = (0,0) \end{cases}$
- Evaluate $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$ using polar coordinates and state whether this function is continuous at $(0,0)$.
 - Find $\frac{\partial f}{\partial x}(0,0)$ and $\frac{\partial f}{\partial y}(0,0)$.
6. Find the directional derivative $\mathbf{D}_{\mathbf{v}}f(2,3)$ for $f(x,y) = x^3y - 3x^2$ in the same direction as the vector $\mathbf{v} = \langle 3, -4 \rangle$. What can you say about the slope of the surface $z=f(x,y)$ at $(2,3,12)$ in the direction given by \mathbf{v} ?
7. Let $f(x,y) = \begin{cases} \frac{xy}{\sqrt{x^2 + y^2}} & \text{if } (x,y) \neq (0,0) \\ 0 & \text{if } (x,y) = (0,0) \end{cases}$
- Evaluate $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$ using polar coordinates and state whether this function is continuous at $(0,0)$.
 - Find $\frac{\partial f}{\partial x}(0,0)$ using the limit definition of partial derivative.
8. Find an equation for the tangent plane to the double-cone $z^2 = x^2 + y^2$ at the point (a,b,c) , which could be any point on the cone (so your tangent plane equation will involve a, b , and c as well as x, y , and z). Use this equation to show that the tangent plane passes through the origin, no matter which point (a,b,c) we chose on the cone.
9. The shape of a space probe entering the Earth's atmosphere is the ellipsoid $4x^2 + y^2 + 4z^2 = 16$. The probe's surface is heated by re-entry so that at a particular time the temperature is given by $T(x,y,z) = 8x^2 + 4yz - 16z + 600$. Find the hottest point(s) on the probe's surface.
10. Find the absolute maximum and minimum values of the function $f(x,y,z) = x - y + z$ subject to the constraint $x^2 + y^2 + z^2 = 1$.
11. Find the local maxima, local minima, and saddle points of the function $f(x,y) = x^2 + 6xy + 10y^2 - 4y + 4$.

Answers: **1.** DNE (prove by finding two directions with different limits); **2.** DNE; **3.** 0 (can use polar coordinates); **4.** (a) $z = 8 - 10(x-3) + 20(y-2)$ (b) 7.0; **5.** (a) Yes, f is continuous at $(0,0)$ (b) Partial derivatives at $(0,0)$ equal 5 and 0, respectively. **6.** $\mathbf{D}_{\mathbf{v}}f(2,3) = 8$, surface is sloping steeply up in this direction; **7.** (a) 0, is continuous, (b) 0. **8.** Note that $c^2 = a^2 + b^2$ since (a,b,c) is on the cone. The gradient of $F(x,y,z) = x^2 + y^2 - z^2$ is orthogonal to the surface $F(x,y,z) = 0$, so a normal vector at (a,b,c) is $\langle 2a, 2b, -2c \rangle$. The tangent plane is $ax + by - cz = 0$, and the point $(0,0,0)$ satisfies this equation so lies on the tangent plane. **9.** Hottest points on surface are $(4/3, -4/3, -4/3)$ and $(-4/3, -4/3, -4/3)$. **10.** Absolute max of $\sqrt{3}$ at $(1, -1, 1)/\sqrt{3}$ and absolute min of $-\sqrt{3}$ at $(-1, 1, -1)/\sqrt{3}$. **11.** $f(-6, 2) = 0$ is the local minimum (no other extrema).

Practice Exam

- The equations $z = f(x, y)$ and $F(x, y, z) = f(x, y) - z = 0$ describe the same surface in 3-space, yet ∇f and ∇F are not the same vectors.
 - Write down ∇f and ∇F in terms of the partial derivatives of f .
 - If $f(1,2) = 5$ and $\nabla f(1,2) = 2\mathbf{i} - 3\mathbf{j}$, find a vector normal to the surface $z = f(x, y)$ at the point with $x=1$ and $y=2$, and write down an equation for the tangent plane to the surface at that point.
- Find all points on the surface $z = 3x^2 - 4y^2$ where the vector $\langle 3, 2, 2 \rangle$ is perpendicular to the tangent plane.
- A flat circular plate is bounded by $x^2 + y^2 = 4$. The plate (including the boundary) is heated so that the temperature is $T(x, y) = x^2 + 3y^2 + 6y + 12$ at each point (x, y) on the plate. Find the temperatures at the hottest and coldest points on the boundary $x^2 + y^2 = 4$ of the plate.
- Suppose $\nabla f = \langle -3, 0 \rangle$.
 - In what direction(s) does the directional derivative $\mathbf{D}_u f$ take its maximum value?
 - In what direction(s) does the directional derivative $\mathbf{D}_u f$ take its minimum value?
 - In what direction(s) does the directional derivative $\mathbf{D}_u f$ equal 0?
 - In what direction(s) does the directional derivative $\mathbf{D}_u f$ equal half of its minimum value?
- Let $f(x, y) = \begin{cases} \frac{x^3 - y^3}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$
 - Evaluate $\lim_{(x,y) \rightarrow (0,0)} f(x, y)$ using polar coordinates and state whether this function is continuous at $(0, 0)$.
 - Find $\frac{\partial f}{\partial x}(0, 0)$ and $\frac{\partial f}{\partial y}(0, 0)$ using the limit definition of partial derivative.

Brief answers: 1. $\nabla F = \langle f_x, f_y, -1 \rangle$ but $\nabla f = \langle f_x, f_y \rangle$, $2x - 3y - z + 9 = 0$. 2. $(-1/4, 1/8, 1/8)$.

3. Hottest 36 at $(0, 2)$, coldest 11.5 at $(\pm\sqrt{7}/2, -3/2)$. 4a. $\langle -1, 0 \rangle$ 4b. $\langle 1, 0 \rangle$ 4c. $\langle 0, 1 \rangle$ and $\langle 0, -1 \rangle$ 4d. $\langle 1/2, \pm\sqrt{3}/2 \rangle$ 5a. 0, continuous 5b. $f_x(0, 0) = 1$ and $f_y(0, 0) = -1$

Practice Exam (no solutions available)

1. Suppose a region of vigorously rolling terrain can be modeled by

$$f(x,y) = 1200 + 400 \sin\left(\frac{\pi}{1000}x + \frac{\pi}{500}y\right),$$

where $f(x,y)$ is the elevation in feet at the point (x,y) , x is the distance east of $(0,0)$, and y is the distance north of $(0,0)$, both measured in feet.

Suppose you are located 600 feet east and 700 feet north of $(0,0)$.

- What is your elevation?
 - If you travel **west** from your location, what is the slope of the surface?
 - If you travel **north** from your location, what is the slope of the surface?
 - In what direction is the **steepest** slope? Please express as a unit vector.
 - In what direction(s) can you go to stay at the same elevation? Please express as unit vector(s).
2. You are given only the following information about a differentiable function f :
- $$f(2, -3) = 8, \quad f(2.01, -3) = 7.9, \quad f(2, -2.98) = 7.6.$$
- Approximate the equation of the tangent plane to the surface $z=f(x,y)$ at $(2, -3, 8)$.
 - Use part (a) to estimate the value of $f(1.98, -3.02)$.

3. Let $f(x,y) = \begin{cases} \frac{3x^3 + 5x^2y - 2y^3}{x^2 + y^2} & \text{if } (x,y) \neq (0,0) \\ 0 & \text{if } (x,y) = (0,0) \end{cases}$

- Evaluate $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$ using polar coordinates and state whether this function is continuous at $(0,0)$.
 - Find $\frac{\partial f}{\partial x}(0,0)$ and $\frac{\partial f}{\partial y}(0,0)$.
4. Find the local maxima, local minima, and saddle points of the function $f(x,y) = 6x^2 - 2x^3 + 3y^2 + 6xy$.
5. Find an equation for the tangent plane to the cone $z^2 = x^2 + y^2$ at the point (a,b,c) , which could be any point on the cone (so your tangent plane equation will involve a , b , and c as well as x , y , and z). Use this equation to show that the tangent plane passes through the origin, no matter which point (a,b,c) we chose on the cone.
